SACRAMENTO

Dear Ms. Oshita;

I am opposed to the flouridation of San Diego's public water supply. It is unsafe to add any chemical to the shared water commons upon which all life is dependent.

What will be the effect of constant consumption of flouridated water on our bones, tissues and kidneys? How will this effect babies under two years of age, the elderly, and those with already compromised health? What effect will this have on the wildlife, bees, birds, trees, and vegetation? How will this chemical interact with peoples' prescription or over the counter medications? How will this effect people with allergies? Dialysis patients? How will flouride interact with chemicals that already exist in our water supply from agriculture, household chemicals, and industry runoff? And what will be the long term effects of growing our food, swimming, bathing, breathing and consuming this flouridated water?

Water is a commons which must be shared equally among all life. It must be respected and held in trust in a pristine state for the well being of nature and of future generations. California already has challenges with water quantity and quality. Please do your part to protect what we have left from further chemical poisoning, and to stop the mass flouridation of our water supply.

I thank you for considering my comments.

Sincerely,
Helen M. Bourne
