Ms. Esther Barajas-Ochoa,

There is NO safe level of glyphosate exposure. I don't want my family exposed to this harmful chemical.

It can be found in tap water, our children's urine, mother's breastmilk, and childhood vaccines.

Review Monika Kruger of Germany's work regarding the bioaccumulation in bone marrow, muscle tissues etc.

Glyphosate has been shown to be a neurotoxin, chelator, antibiotic, and carcinogen which also causes liver disease.

One way glyphosate functions is by breaking down the blood-brain barrier and allowing other toxins (such as those found in vaccines and herbicides) into the brain.

Thank you for your consideration,

Claudia
