I urge that the Prop 65 NSRL (No Significant Risk Level) for glyphosate must be a validly arrived at NSRL, per CA regulations, substantially lower than the proposed 1100 micrograms per day, in order for this Safe Harbor to actually be safe to Californians. Until a comprehensive independent study is done, showing real life exposure levels, regulatory authorities should use a NSRL of well below, the concentration where it stimulated breast cancer cells in vitro at levels as low as 1 ppt (Thongprakaisang et al., 2013), in keeping with The Precautionary Principle.

Thank you for your concern,
Catherine Steele
